Office Action dated: December 22, 2010

This listing of claims will replace all prior versions, and listings, of claims in the application:

## **Listing of the Claims**

 (previously presented) In a video encoder, a method for video encoding a block comprising: combining a first prediction of a current block with a second prediction of a current block; wherein the first prediction of the current block is intra prediction and the second prediction of the current block is inter prediction.

(original) The method of claim 1, wherein encoding the block includes combining the first prediction and the second prediction and a third prediction of the current block.

(original) The method of claim 1, wherein the current block is coded as a Direct mode block.

 (original) The method of claim 1, further comprising reducing the filter strength of a deblocking filter adapted to increase the correlation between pixels adjacent to the current block.

(original) The method of claim 1, wherein the second prediction is a null block prediction.

(original) The method of claim 1, wherein the first prediction and the second prediction are combined by averaging the first prediction and the second prediction.

 (original) The method of claim 1, wherein the first prediction and the second prediction are combined by weighting each of the first prediction and the second prediction.

8. (original) The method of claim 1, wherein the current block is a 16 x 16 macroblock.

CUSTOMER NO.: 24498

Serial No.: 10/569,236 Office Action dated: December 22, 2010 PATENT PU030258

9. (original) The method of claim 1, wherein the current block is a sub-macroblock.

10. (original) The method of claim 1, wherein the current block is a 4 x 4 sub-

macroblock partition.

11. (previously presented) In a video encoder, a method of video encoding for

compressing and encoding frames of a two-dimensional image sequence for transmission comprising; dividing a frame of the image sequence into blocks, selecting blocks and encoding

the selected blocks in a bi-predictive hybrid intra-inter encoding mode into a bitstream for

transmission.

12. (original) The method of video encoding of claim 11 further comprising transmitting

the bitstream containing the intra-inter encoded blocks.

13. (original) A video encoder for encoding blocks within frames of a sequence of two

dimensional images, the encoder comprising: an intra-frame prediction block being operatively

connected to a combining unit and for outputting a first intra prediction of a block; and an inter-

frame prediction block being operatively connected to the combining unit and for outputting a first inter prediction of the block; wherein the combining unit is adapted to combine the first intra

prediction and the first inter prediction and to output a hybrid intra-inter coded block.

14. (original) The video encoder of claim 13 wherein the combining unit is adapted to

weight at least one of the first intra prediction of the block and the first inter prediction of the

block prior to additively combining them.

15. (original) The video encoder of claim 13 wherein the combining unit is adapted to

average together the first intra prediction of the block and the first inter prediction of the block.

3

CUSTOMER NO.: 24498 Serial No.: 10/569.236

Office Action dated: December 22, 2010

16. (original) The video encoder of claim 13 wherein the hybrid intra-inter coded block

PATENT

PU030258

is the average of the first intra prediction and the first inter prediction.

17. (original) The video encoder of claim 13, wherein the intra-frame prediction block is

adapted to output a second intra prediction of the block; and the wherein the combining unit is

further adapted to additively combine the first intra prediction and the second intra prediction.

18. (original) The video encoder of claim 13, wherein the inter-frame prediction block is

further adapted to output a second inter prediction of the block; and wherein the combining unit

is further adapted to combine the first inter prediction and the second inter prediction.

19. (previously presented) A video encoder for compressing and encoding frames of a

two dimensional image sequence for transmission, the video encoder being adapted to select

blocks from at least one frame of the image sequence and to encode the selected blocks by

combining a first prediction and a second prediction, wherein the encoder is further adapted to

select for encoding one of the selected blocks, between an intra encoding mode of the related art,

an inter encoding mode of the related art, and a bi-predictive hybrid intra-inter encoding mode.

an inter encouning mode of the related art, and a pi-predictive hybrid intra-liner encouning mode.

20. (original) The video encoder of claim 19, wherein the second prediction is an inter

prediction of the current block.

21. (original) The video encoder of claim 19, wherein the second prediction is an intra

prediction of the current block.

22. (cancelled)

23. (previously presented) The video encoder of claim 19 wherein coding the current

block in the hybrid intra-inter encoding mode outputs the average of the intra prediction of the

current block and an inter prediction of the current block.

4

CUSTOMER NO.: 24498 PATENT Serial No.: 10/569,236 PU030258

Office Action dated: December 22, 2010

24. (previously presented) The video encoder of claim 19 wherein coding the current block in the hybrid intra-inter encoding mode outputs a weighted additive combination of the

intra prediction of the current block and an inter prediction of the current block.

25. (original) A mobile telephone comprising a video encoder as claimed in claim 13.

26. (previously presented) A multimedia terminal, comprising a video encoder adapted

to encode a digital video sequence using motion compensated prediction, said digital video

sequence comprising a number of frames, wherein the video encoder is adapted to select blocks from at least one frame of the image sequence and to encode the selected blocks; wherein

encoding each of the blocks includes combining a first prediction and a second prediction.

wherein the encoder is further adapted to select for encoding one of the selected blocks, between

,

an intra encoding mode of the related art, an inter encoding mode of the related art, and a bi-

predictive hybrid intra-inter encoding mode.

27. (previously presented) A non-transitory computer-usable medium having a

computer-readable program code embodied therein for causing a computer system to perform the

method of claim 1.

28. (previously presented) A non-transitory recording medium that stores a program,

readable by a computer, for causing a computer system to perform the method of claim 1.

29. (previously presented) In a video encoder, a method for video encoding a block

comprising: combining a first prediction type for a current block with a second prediction type

for a current block; wherein the combination of the first prediction type and the second

prediction type forms a hybrid prediction type.

30. (original) The method of claim 29 wherein the step of combining is accomplished

using a summing block.

5

CUSTOMER NO.: 24498

Serial No.: 10/569,236

Office Action dated: December 22, 2010

PATENT PU030258

31. (original) The method of claim 29 wherein the step of combining the two prediction types is accomplished by performing a simple average of the two prediction types.

- 32. (original) The method of claim 29 wherein the step of combining the two prediction types is accomplished by applying a weighted combination of the two prediction types.
  - 33. (cancelled)
